

IAM Prediction: CMB Hemispherical Power Asymmetry
from de Sitter Causal Boundary + ISW Enhancement ($\Sigma = 1$, zero free parameters)

IAM Prediction Chain
(Zero free parameters)

- De Sitter causal boundary**
Each observer: 2π accessible,
 2π inaccessible (exact by symmetry)
→ Paper 31, Mahaffey 2026
- IAM growth modification**
 $\mu(a) = H_\Lambda^2 / (H_\Lambda^2 + \beta_m E(a))$
 $\beta_m = \Omega_m / 2 = 0.1577$ (virial theorem)
 $\mu_{\text{avg}}(1) = 0.8638$
→ Confirmed by 17 Planck 2018 MCMC chains
- Hemisphere split**
 $\mu_- = 1.000$ (inaccessible, pure GR)
 $\mu_+ = 2\mu_{\text{avg}} - 1 = 0.7277$
- ISW enhancement**
 $A_{\text{ISW}}^{\text{IAM}} / A_{\text{ISW}}^{\Lambda} = 1.134$
(+13.4% on accessible hemisphere)
→ IAM Survey Predictions Paper
- Hemispherical asymmetry**
 $A = (1.134 - 1.000) / (1.134 + 1.000)$
 $A_{\text{IAM}} = 0.0628$

Observed (Planck 2018):

$A_{\text{obs}} = 0.056 \pm 0.021$

Tension: 0.15σ
