

One gauge for every record IAM reads

1 = healthy, in the middle · $H_{\min}$ = the floor where thermal kicks win; nothing reads below it · above 1 = more error

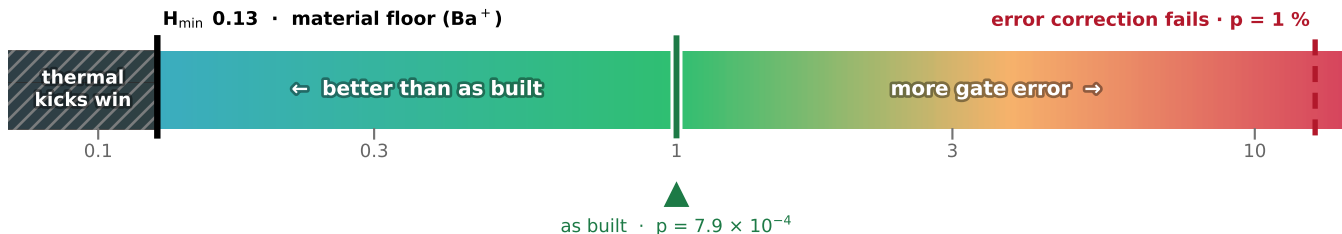

Cell · neutrophil · IAM-A

copy error at each CpG, read on single molecules

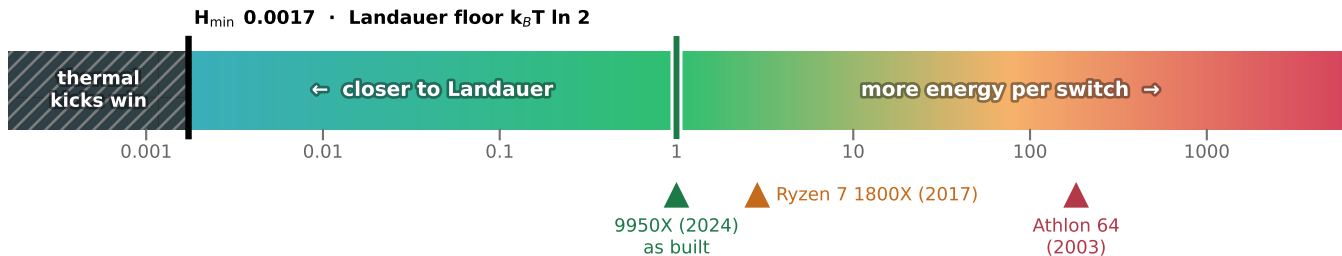

Qubit · Quantinuum Helios · two-qubit gate

gate error $\epsilon = -\ln(1 - p)$

Chip · AMD Ryzen 9 9950X · switching energy

$E = \text{TDP} / (N f)$; earlier AMD chips on the same scale

A = reading ÷ the same system's healthy reading (log scale, each gauge centred on 1)
