Sample report: S6_AK0005_buffy_coat_EPICv2

AstroGenetics: the physics of methylation, read on one sample

Specimen buffy coat · platform EPIC_v2

Research use only. Not a diagnostic test. Each reading is printed with its commissioning status: *commissioned* means it passed a test sealed before its data was seen; a reading outside what an instrument was tested on is still shown, and says so. The full technical record (intake, calibration, tare, noise gate, safeguards, integrity, and how to run it yourself) is in the HTML report.

At a glance

Instrument	Question it answers	Reading	State	Status
IAM-Deconvolver	Which cells, in what shares			not run (no array input)
Met-A	How far the neutrophil's tagging level has moved			refused: EPIC v2 array (IDAT header): the chain reads EPIC v1 arrays only - no frozen neutrophil floor for EPIC v2, and Stage 1 (methylprep 1.7.1) does not calibrate EPIC v2. Intake stopped before the QC decode; nothing is scored.
C-Score	Are the departures clustered or scattered			not run
IAM-A	Is each mark still held, against the sample's own reference			not run (no sequencing input)
