Sample report: S6_AK0005_saliva_EPICv1

AstroGenetics: the physics of methylation, read on one sample

Specimen saliva · platform sequencing

Research use only. Not a diagnostic test. Each reading is printed with its commissioning status: *commissioned* means it passed a test sealed before its data was seen; a reading outside what an instrument was tested on is still shown, and says so. The full technical record (intake, calibration, tare, noise gate, safeguards, integrity, and how to run it yourself) is in the HTML report.

At a glance

Instrument	Question it answers	Reading	State	Status
IAM-Deconvolver	Which cells, in what shares			not run (no array input)
Met-A	How far the neutrophil's tagging level has moved			refused: specimen 'saliva' refused at intake: 'saliva' is not a blood specimen the chain has a reference for (tissue, placenta and other specimens each need their own reference). Accepted: whole blood, isolated / sorted / purified neutrophils. Nothing is read; this specimen can be read once it has its own reference.
C-Score	Are the departures clustered or scattered			not run
IAM-A	Is each mark still held, against the sample's own reference			not run (no sequencing input)
