Sample report: ROUTE

The information physics of methylation, read on one sample

Specimen cell line · platform sequencing values (development)

Research use only. Not a diagnostic test. Each reading is printed with its commissioning status: *commissioned* means it passed a test sealed before its data was seen; a reading outside what an instrument was tested on is still shown, and says so. The full technical record (intake, calibration, tare, noise gate, safeguards, integrity, and how to run it yourself) is in the HTML report.

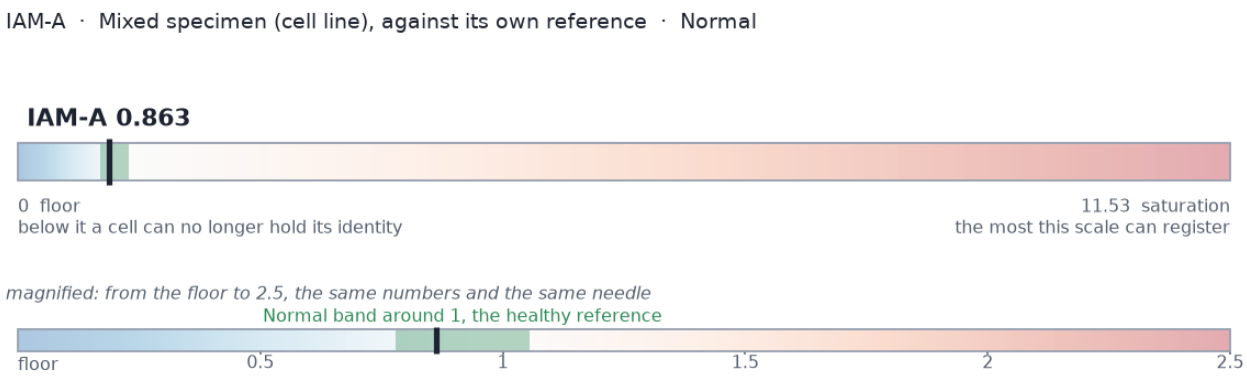

The readings, in plain words

Each gauge runs from 0, the floor (below it a cell can no longer hold its identity), through 1, healthy, to saturation, the most the scale can register. Healthy cells sit in the green band around 1. Moving right means the marks are being lost.

Which cells are in the sample

Naive b cells 56 %, Lung interstitial macrophages 36 %, T effector memory cd4 4 %, Fallopien tubes epithelium 2 %, read against the 79-cell IAM-Atlas v2.1.

IAM-A

Whether each mark is still held, read against this sample's own reference: no other person is needed.
