

Compact stars on the same gauge

1 = the typical remnant as built · far right = surface full: no pressure can hold, a horizon forms · beyond = black hole

White dwarfs · held up by electron pressure

1 = typical ($0.6 M_{\odot}$)

surface full · 2.40
Chandrasekhar $1.44 M_{\odot}$

black hole

Neutron stars · held up by neutron pressure

1 = typical ($1.4 M_{\odot}$)

surface full · 1.64
TOV $\approx 2.3 M_{\odot}$

black hole

A = core mass ÷ the typical remnant's mass (each row its own scale)
