

Temperature correction unifies methylation entropy across all jawed vertebrates

$$A(T) = H(\beta) / [H_{\min}^{37^{\circ}\text{C}} \times (T_{\text{body}}/310.15 \text{ K})^{\alpha}], \quad \alpha = 2.0$$

Raw A-scores vs body temperature
 $r = +0.835$, $p = 1.8\text{e-}08$

Temperature-corrected A-scores
 $r = +0.627$, $p = 2.7\text{e-}04$
